

Reflection log chapter 4

Reflection Log Exercise 3

1:

I started with my variables as they were the most important in the code, no confusions came upon me when I started the code

2:

Breaking into 3 blocks of code and not making it all at once with variables be first, then the if and else if statements and the calculations and output last

3:

Every step of the way, I ran the code to make sure it worked as intended

4:

The most difficult part was how to calculate the extra eggs that were not part of the dozen and how to implement the formula into my code. When I felt stuck I just did trial and errors till it worked

5:

I learned how to use different types of variables types such as double and int more effectively

Reflection Log Exercise 5

1:

I did the similar steps of exercise 3 (also reused exercise 3 code) starting with the else and if statements first though with no confusion at the time

2:

I had a 2 step process to finish this code, the if and else statements, and the input/output printing

3:

I wrote the code all the way through and then tested it with fixing between tests to make sure the code worked alright

4:

The difficult part was the polishing, making sure that all worked as intended, cleaning up any errors that popped up. I felt stuck when my "char" variable didn't work and so I used the string attribute, it ran great

5:

I learned how to use if, else if, and else code to make it run specific required items and not everything all at once ex. All letter grades when it is only supposed to run one
